

**FORESMAC - next-generation systems, prediction and active monitoring, of the natural forest spaces in Macaronesia**

(Ref. MAC/2.3/C16)

**Characterization:**

Development of a next-generation system for observation, prediction and active monitoring of natural forest. This project aims to implement a web application that allows viewing the data (temperature, light, size, voltage, etc..) Generated by a network of wireless sensors. These data will be stored in a database in XML format and accessed through web application.
